Brand New Book \*\*\*\*\* Print on Demand \*\*\*\*\*.Excerpt from Theories of Program Testing and the Application of Revealing Sub-Domains The theory of test data selection proposed by Goodenough and Gerhart is examined and a number of theoretical and pragmatic deficiencies are identified. The concepts of a revealing test criterion and a revealing subdomain are proposed to overcome some of these weaknesses, and to provide a realistic basis for a theory of testing. A subset of a program s input domain is revealing if the existence of one incorrectly processed input implies that all the subset s elements are processed incorrectly. The intent of this notion is to partition the program s domain in such a way that all elements of an equivalence class are either processed correctly or incorrectly. A program test set is then formed by choosing one element from each class. The technique is especially useful for programs whose computations depend on a classification of their input domain, but it can also be useful for programs which process their entire domain uniformly. A methodology for forming revealing subdomain partitions is described, and illustrated with three examples to which other testing methodologies have been applied in the literature.
